# REFERENCE

## 1.1 thinkrf.devices

**class** `thinkrf.devices.WSA4000`

Interface for WSA4000

`connect()` must be called before other methods are used.

**ADC\_DYNAMIC\_RANGE** = 72.5

**antenna** (*number=None*)

This command selects and queries the active antenna port.

**Parameters** **number** – 1 or 2 to set; None to query

**Returns** active antenna port

**capture** (*spp, ppb*)

This command will start the single block capture and the return of *ppb* packets of *spp* samples each. The data within a single block capture trace is continuous from one packet to the other, but not necessary between successive block capture commands issued.

**Parameters**

- **spp** – the number of samples in a packet
- **ppb** – the number of packets in a capture

**connect** (*host*)

connect to a wsa

**Parameters** **host** – the hostname or IP to connect to

**decimation** (*value=None*)

This command sets or queries the rate of decimation of samples in a trace capture. This decimation method consists of cascaded integrator-comb (CIC) filters and at every *value* number of samples, one sample is captured. The supported rate is 4 - 1023. When the rate is set to 1, no decimation is performed on the trace capture.

**Parameters** **value** (*int*) – new decimation value (1 or 4 - 1023); None to query

**Returns** the decimation value

**disconnect** ()

close a connection to a wsa

**eof** ()

Check if the VRT stream has closed.

**Returns** True if no more data, False if more data

**flush()**

Flush capture memory of sweep captures.

**flush\_captures()**

Flush capture memory of sweep captures.

**freq** (*freq=None*)

This command sets or queries the tuned center frequency of the WSA.

**Parameters** **freq** (*int*) – the new center frequency in Hz (0 - 10 GHz); None to query

**Returns** the frequency in Hz

**fshift** (*shift=None*)

This command sets or queries the frequency shift value.

**Parameters** **freq** (*int*) – the new frequency shift in Hz (0 - 125 MHz); None to query

**Returns** the amount of frequency shift

**gain** (*gain=None*)

This command sets or queries RFE quantized gain configuration. The RF front end (RFE) of the WSA4000 consists of multiple quantized gain stages. The gain corresponding to each user-selectable setting has been pre-calculated for either optimal sensitivity or linearity. The parameter defines the total quantized gain of the RFE.

**Parameters** **gain** – ‘high’, ‘medium’, ‘low’ or ‘vlow’ to set; None to query

**Returns** the RF gain value

**has\_data()**

Check if there is VRT data to read.

**Returns** True if there is a packet to read, False if not

**have\_read\_perm()**

Check if we have permission to read data.

**Returns** True if allowed to read, False if not

**id()**

Returns the WSA4000’s identification information string.

**Returns** “<Manufacturer>,<Model>,<Serial number>,<Firmware version>”

**ifgain** (*gain=None*)

This command sets or queries variable IF gain stages of the RFE. The gain has a range of -10 to 34 dB. This stage of the gain is additive with the primary gain stages of the LNA that are described in [gain\(\)](#).

**Parameters** **gain** – float between -10 and 34 to set; None to query

**Returns** the ifgain in dB

**locked** (*modulestr*)

This command queries the lock status of the RF VCO (Voltage Control Oscillator) in the Radio Front End (RFE) or the lock status of the PLL reference clock in the digital card.

**Parameters** **modulestr** – ‘vco’ for rf lock status, ‘clkref’ for mobo lock status

**Returns** True if locked

**preselect\_filter** (*enable=None*)

This command sets or queries the RFE preselect filter selection.

**Parameters** `enable` – True or False to set; None to query

**Returns** the RFE preselect filter selection state

**raw\_read** (*num*)

Raw read of VRT socket data from the WSA.

**Parameters** `num` – the number of bytes to read

**Returns** bytes

**read** ()

Read a single VRT packet from the WSA.

See `thinkrf.vrt.Stream.read_packet()`.

**request\_read\_perm** ()

Acquire exclusive permission to read data from the WSA.

**Returns** True if allowed to read, False if not

**reset** ()

Resets the WSA4000 to its default settings. It does not affect the registers or queues associated with the IEEE mandated commands.

**scpiget** (*cmd*)

Send a SCPI command and wait for the response.

This is the lowest-level interface provided. Please see the Programmer's Guide for information about the commands available.

**Parameters** `cmd` (*str*) – the command to send

**Returns** the response back from the box if any

**scpiiset** (*cmd*)

Send a SCPI command.

This is the lowest-level interface provided. Please see the Programmer's Guide for information about the commands available.

**Parameters** `cmd` (*str*) – the command to send

**sweep\_add** (*entry*)

Add an entry to the sweep list

**Parameters** `entry` (`thinkrf.config.SweepEntry`) – the sweep entry to add

**sweep\_clear** ()

Remove all entries from the sweep list.

**sweep\_read** (*index*)

Read an entry from the sweep list.

**Parameters** `index` – the index of the entry to read

**Returns** sweep entry

**Return type** `thinkrf.config.SweepEntry`

**sweep\_start** (*start\_id=None*)

Start the sweep engine.

**sweep\_stop** ()

Stop the sweep engine.

**trigger** (*settings=None*)

This command sets or queries the type of trigger event. Setting the trigger type to “NONE” is equivalent to disabling the trigger execution; setting to any other type will enable the trigger engine.

**Parameters** *settings* (*thinkrf.config.TriggerSettings*) – the new trigger settings; None to query

**Returns** the trigger settings

## 1.2 thinkrf.config

```
class thinkrf.config.SweepEntry (fstart=2400000000, fstop=2400000000, fstep=100000000,
                                fshift=0, decimation=0, antenna=1, gain='vlow', ifgain=0,
                                spp=1024, ppb=1, trigtype='none', level_fstart=500000000,
                                level_fstop=10000000000, level_amplitude=-100)
```

Sweep entry for `thinkrf.devices.WSA4000.sweep_add()`

### Parameters

- **fstart** – starting frequency in Hz
- **fstop** – ending frequency in Hz
- **shift** – the frequency shift in Hz
- **decimation** – the decimation value (0 or 4 - 1023)
- **antenna** – the antenna (1 or 2)
- **gain** – the RF gain value ('high', 'medium', 'low' or 'vlow')
- **ifgain** – the IF gain in dB (-10 - 34)
- **spp** – samples per packet
- **ppb** – packets per block
- **trigtype** – trigger type ('none' or 'level')
- **level\_fstart** – level trigger starting frequency in Hz
- **level\_fstop** – level trigger ending frequency in Hz
- **level\_amplitude** – level trigger minimum in dBm

```
class thinkrf.config.TriggerSettings (trigtype='NONE', fstart=None, fstop=None, ampli-
                                     tude=None)
```

Trigger settings for `thinkrf.devices.WSA4000.trigger()`.

### Parameters

- **trigtype** – “LEVEL” or “NONE” to disable
- **fstart** – starting frequency in Hz
- **fstop** – ending frequency in Hz
- **amplitude** – minimum level for trigger in dBm

**exception** `thinkrf.config.TriggerSettingsError`

## 1.3 thinkrf.vrt

**class** `thinkrf.vrt.ContextPacket` (*pkt\_type, word, socket*)

A Context Packet received from `thinkrf.vrt.Stream.read_packet()`

**fields**

a dict containing field names and values from the packet

**is\_context\_packet** (*p\_type=None*)

**Parameters** *p\_type* – “Receiver”, “Digitizer” or None for any packet type

**Returns** True if this packet matches the type passed

**is\_data\_packet** ()

**Returns** False

**class** `thinkrf.vrt.DataPacket` (*word, socket*)

A Data Packet received from `thinkrf.vrt.Stream.read_packet()`

**data**

a `thinkrf.vrt.IQData` object containing the packet data

**is\_context\_packet** (*p\_type=None*)

**Returns** False

**is\_data\_packet** ()

**Returns** True

**class** `thinkrf.vrt.IQData` (*binary\_data*)

Data Packet values as a lazy collection of (I, Q) tuples read from *binary\_data*.

This object behaves as an immutable python sequence, e.g. you may do any of the following:

```
points = len(iq_data)
```

```
i_and_q = iq_data[5]
```

```
for i, q in iq_data:
    print i, q
```

**numpy\_array** ()

Return a numpy array of I, Q values for this data similar to:

```
array([[ -44,    8],
       [ -40,   60],
       [ -12,   92],
       ...,
       [-132,   -8],
       [-124,   56],
       [ -44,   80]], dtype=int16)
```

**exception** `thinkrf.vrt.InvalidDataReceived`

**class** `thinkrf.vrt.Stream` (*socket*)

A VRT Packet Stream interface wrapping *socket*.

**has\_data** ()

**Returns** True if there is data waiting on *socket*.

**read\_packet()**

Read a complete packet from *socket* and return either a `thinkrf.vrt.ContextPacket` or a `thinkrf.vrt.DataPacket`.

## 1.4 thinkrf.util

`thinkrf.util.read_data_and_reflevel(dut, points=1024)`

Wait for and capture a data packet and a reference level packet.

**Returns** (data\_pkt, reflevel\_pkt)

`thinkrf.util.socketread(socket, count, flags=None)`

Retry socket read until count data received, like reading from a file.

## 1.5 thinkrf.numpy\_util

`thinkrf.numpy_util.compute_fft(dut, data_pkt, reflevel_pkt)`

Return an array of dBm values by computing the FFT of the passed data and reference level.

**Parameters**

- **dut** (*thinkrf.devices.WSA4000*) – WSA device
- **data\_pkt** (*thinkrf.vrt.DataPacket*) – packet containing samples
- **reflevel\_pkt** (*thinkrf.vrt.ContextPacket*) – packet containing 'reflevel' value

This function uses only `dut.ADC_DYNAMIC_RANGE`, `data_pkt.data` and `reflevel_pkt['reflevel']`.

**Returns** numpy array of dBm values as floats

---

# BASIC EXAMPLES

## 2.1 show\_i\_q.py

This example connects to a device specified on the command line, tunes it to a center frequency of 2.450 MHz then reads and displays one capture of 1024 i, q values.

```
#!/usr/bin/env python

import sys
from thinkrf.devices import WSA4000

# connect to wsa
dut = WSA4000()
dut.connect(sys.argv[1])

# setup test conditions
dut.reset()
dut.request_read_perm()
dut.ifgain(0)
dut.freq(2450e6)
dut.gain('low')
dut.fshift(0)
dut.decimation(0)

# capture 1 packet
dut.capture(1024, 1)

# read until I get 1 data packet
while not dut.eof():
    pkt = dut.read()

    if pkt.is_data_packet():
        break

# print I/Q data into i and q
for i, q in pkt.data:
    print "%d,%d" % (i, q)
```

Example output (truncated):

```
0,-20
-8,-16
0,-24
-8,-12
```

```
0,-32
24,-24
32,-16
-12,-24
-20,0
12,-32
32,-4
0,12
-20,-16
-48,16
-12,12
0,-36
4,-12
```

## 2.2 plot\_fft.py

This example connects to a device specified on the command line, tunes it to a center frequency of 2.450 MHz and sets a trigger for a signal with an amplitude of -70 dBm or greater between 2.400 MHz and 2.480 MHz.

When the trigger is satisfied the data is captured and rendered as a spectrum display using NumPy and matplotlib.

```
#!/usr/bin/env python

from thinkrf.devices import WSA4000
from thinkrf.config import TriggerSettings
from thinkrf.util import read_data_and_reflevel
from thinkrf.numpy_util import compute_fft

import sys
import time
import math

from matplotlib.pyplot import plot, figure, axis, xlabel, ylabel, show

# connect to wsa
dut = WSA4000()
dut.connect(sys.argv[1])

# setup test conditions
dut.reset()
dut.request_read_perm()
dut.ifgain(0)
dut.freq(2450e6)
dut.gain('high')
dut.fshift(0)
dut.decimation(0)
trigger = TriggerSettings(
    trigtype="LEVEL",
    fstart=2400e6,
    fstop=2480e6,
    amplitude=-70)
dut.trigger(trigger)

# capture 1 packet
data, reflevel = read_data_and_reflevel(dut, 1024)
```

```
# compute the fft of the complex data
powdata = compute_fft(dut, data, reflevel)

# setup my graph
fig = figure(1)
axis([0, 1024, -120, 20])

xlabel("Sample Index")
ylabel("Amplitude")

# plot something
plot(powdata, color='blue')

# show graph
show()
```

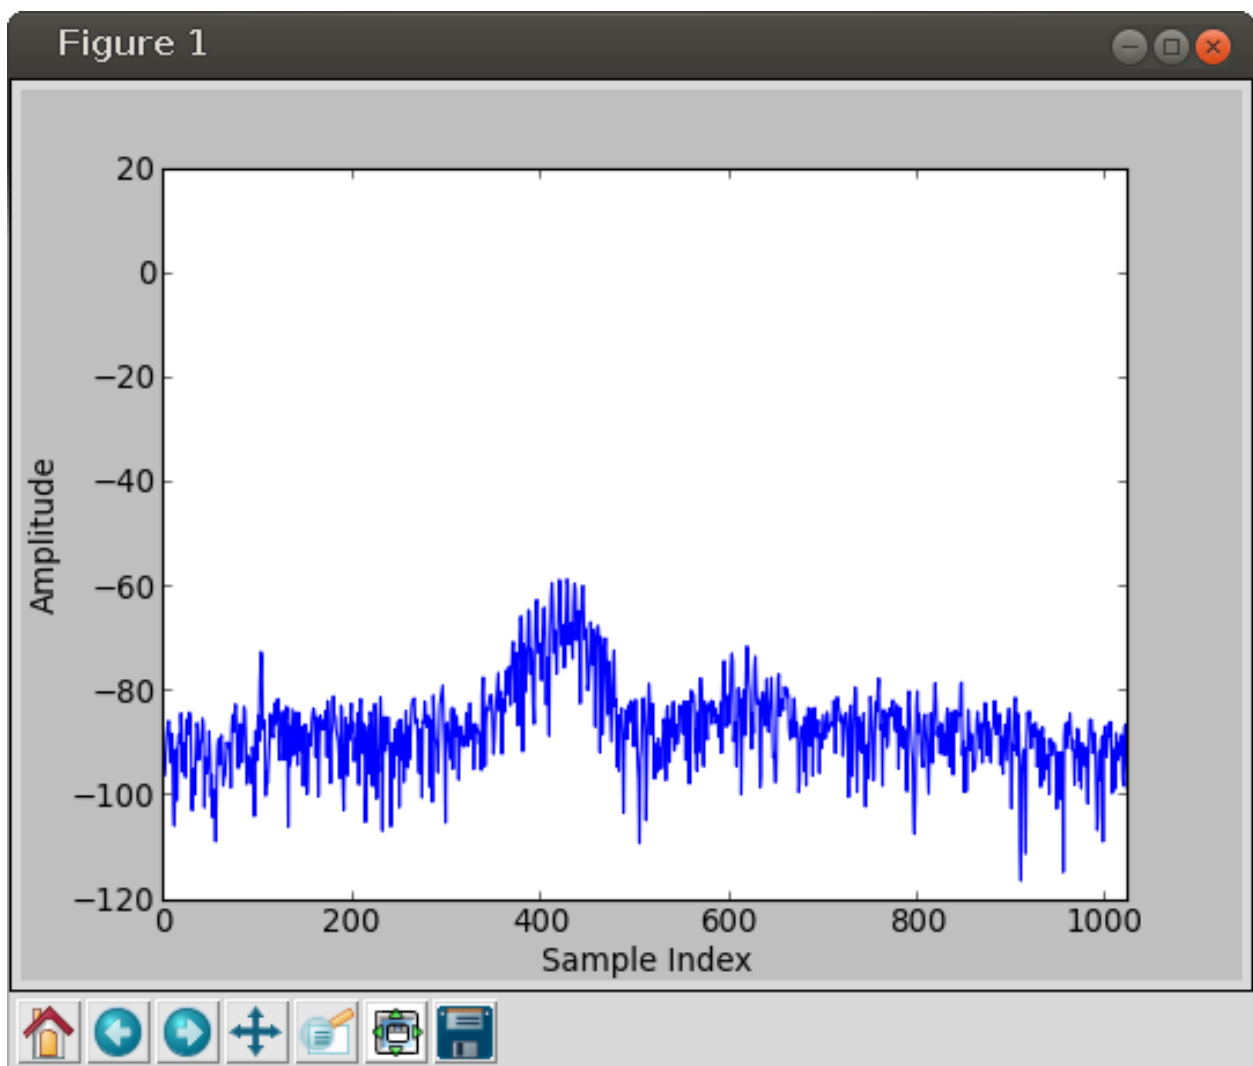

Figure 2.1: Example output of `plot_fft.py`

# GUI EXAMPLE: WSA4000DEMO

`wsa4000demo` is a cross-platform GUI application built with the `Qt` toolkit and `PySide` bindings for Python.

You may run application by launching the `wsa4000demo.py` script in the `examples/gui` directory.

You may specify a device on the command line or open a device after the GUI has launched. Adding `--reset` to the command line parameters will cause the device to be reset to defaults after connecting.

## 3.1 `wsa4000demo.py`

This is the script that launches the application.

```
#!/usr/bin/env python

import sys
from PySide import QtGui
from gui import MainWindow

app = QtGui.QApplication(sys.argv)
ex = MainWindow()
sys.exit(app.exec_())
```

## 3.2 `gui.py`

The main application window and GUI controls are created here.

`MainWindow` creates and handles the `File | Open Device` menu and wraps the `MainPanel` widget responsible for most of the interface.

All the buttons and controls and their callback functions are built in `MainPanel` and arranged on a grid. A `SpectrumView` is created and placed to left of the controls.

---

**Note:** This version calls `MainPanel.update_screen()` in a timer loop 20 times a second. This method makes a blocking call to capture the next packet and render it all in the same thread as the application. This can make the interface slow or completely unresponsive if you lose connection to the device.

The next release will move the blocking call and data processing into a separate process.

---

### 3.3 spectrum.py

The SpectrumView widget is divided into three parts:

- SpectrumViewPlot contains the plotted spectrum data.
- SpectrumViewLeftAxis displays the dBm axis along the left.
- SpectrumViewBottomAxis displays the MHz axis across the bottom.

The utility functions dBm\_labels and MHz\_labels compute the positions and labels for each axis.

```
